

*"The real problem is not just applying the wristband—
it is the disorganized flow that makes each application harder."*

Process step	Option 1 Manual	Option 2 Semi-auto	Option 3 Pre-made	Option 4 Smart
Set up / prep	Manually rip apart	Pre-cut & sort by size	—	—
Label	Write by hand	Sticker label	Pre-printed	Tag / charm (slip on)
Gather kids	Catch at door or bus	Randomly run around	Activity — game / queue	One by one down list
Apply & snap	Staff by hand (or parents)	Automatic machine	Different type?	—
Cut & finish	Belt loop	Wrap back	Cover with sticker	Section / rip round
Verification	Show on bus / entry	Check as applied	Ask the child	—

— indicates no specific action for that option at this step.

Internal process decomposition

I. One-handed	II. Automatic	III. Simplify
Staff holds the child with the other hand	Machine or device does the work	Reduce steps and friction to minimum
Hook mechanism	Dedicated machine	Slide-on closure
Tweezers / purpose-built tool	Magnetic clamp device	Zip-style fastening
Button-punch closure	Box-type applicator	Snap — no alignment needed
Single-hand clasp	Sizing sensor integration	No tool required
Push-lock / punch	Remote-trigger clamp	Directed snap path

Synthesis One-handed tools can combine with automatic mechanisms — e.g. a spring-loaded clamp triggered with one push. Simplification applies across all three columns. Consider: could parents apply the wristband before arrival?

Verb: Put on · Subject: Wristband · Object: Kid's wrist · Goal: One-handed

Biomimicry References

- Shell animals — self-sealing closure on contact
- Burr / velcro — catches and holds without force
- Guided path forces correct orientation automatically
- Repositions on contact without user effort

One-handed Approach

- Nudge child to pause movement momentarily
- Wristband self-positions as it nears the wrist
- Single push or squeeze completes fastening
- Minimal correction needed as a final step

Automatic Approach

- Maximum two steps for staff to complete
- Machine handles all fiddly alignment internally
- Fully kid-proof — not a sequential process
- Remote trigger or proximity-based activation

How Do Staff Track Kids?

- Paw prints / biometric ID as an alternative
- Wristband itself acts as the identifier
- Kids as active participants — game framing
- Clasp, latch, lashing mechanism variants
