

From stakeholder q&A with christine

- From your expertise, how much do children care about comfort?

It is high on the list for most children

- How are the children finding the current wristbands?

Not a lot of feedback received but some say plastic pokes them

- What are the issues that they have with current wristbands (eg: cutting off the excess parts of the wristband?)

Yes, too long must be cut & cannot be opened and reclosed

- Are children more likely to rip their wristbands off if the wristbands are uncomfortable?

Generally will wear for the day but possibly complain and remove once home

1. Could you clarify whether the main concern is children being able to remove the wristbands themselves, or if the issue is more about the wristbands accidentally falling off?

Neither. Saving staff time to apply is more of a concern.

4. Would children accept wristbands that have room/slack without as much ability to change the exact size? (i.e. unlike the current wristbands, staff do not ask which size they exactly prefer.) Essentially, does comfort depend on textures/"poking" parts over the exact amount of slack on the wristband?

Kids would accept slack within reason, maybe an inch. Ability to change the size of band is needed as some kids have bigger/smaller wrists.

Comfort relies on a flexible band that can get wet, easy to dry and does not poke or scratch. Amount of slack is not a major factor if there is an option to trim if needed, comfort will trump.

From interview with another praxis team with context given

Q: what are your thoughts on our design and its implementability in the daycare?

A: i think that the design is very fast, intuitive and easy to use. However, i would be scared to put my hand through the hole.

Q: (they asked): are you planning on having the kids do it themselves?

A: yes with supervision

Proxy Stakeholder Test:

- Described as intuitive and simple
- Minor concerns of it retracting too fast
 - Might scare them
 - Clarify it wont go too tight/hurt them
